TABLE OF CONTENTS

TABLES

APPENDIX

1.0 SUMMARY

On behalf of the Applicant, Morgan Medical Properties LLC, this Stormwater Report was prepared in support of the construction of a parking lot expansion within the 2.603 acre property located at 3405 Highway Route 33 and 3454 W. Bangs Avenue Neptune Township in Monmouth County, New Jersey (Block 3301 Lots 8 & 12). The purpose of this report is to demonstrate the project is in compliance with the Town Municipal Stormwater Management Plan, last revised May 2009.

The proposed project will include a parking lot extension, a porous pavement system and an above ground infiltration basin connected to an existing infiltration system. The proposed project will utilize an existing open space in Block 3301 Lot 12 and will maintain existing drainage patterns as much as practical. The project incorporates stormwater controls designed to provide water quantity, water quality, and groundwater recharge in accordance with the Town ordinance and the New Jersey Stormwater BMP Manual. The proposed project disturbs 0.45 acres and increases impervious area by 0.15 acres.

The stormwater management system and erosion and sediment control measures to be implemented during construction as outlined in the project drawings will reduce the transport of sedimentation off site and maintain the existing water quality and quantity per stormwater requirements.

2.0 SITE DESCRIPTION

2.1 Site Information

The subject property is located within Block 3301, Lot 12 in the Township of Neptune, Monmouth County, New Jersey in the R-2, Residential zoning district. The property is bound by West Bangs Avenue towards the western portion of the property and the existing parking lot and building to the east.

2.2 Existing Conditions

The property is currently vacant land. The overall site generally drains from west to east towards the existing parking lot. The site currently contains two driveways that provided access to a since demolished dwelling. The area of work is approximately 0.45 acres located at the western portion of the property primarily within Lot 12.

2.2.1 Soils

The soil descriptions of the area of work according to the United States Department of Agriculture (USDA) Soil Conservation Service Soil Survey for Monmouth County, NJ is referenced in Appendix A and summarized in the table below.

Table 1: Hydrologic Soil Group Summary

Map Symbol	Description	Hydrologic Soil Group
EvuB	Evesboro sand, 0 to 5 percent slopes	A

2.2.2 Floodplain

According to FEMA's effective Flood Insurance Rate Map (FIRM) for Monmouth County, NJ, Community Panel #34025C0329G, dated 6/15/2022, the area of work is in Zone X. Refer to Appendix A for additional information.

3.0 STORMWATER MANAGEMENT

3.1 Proposed Conditions

According to the Town of Neptune Municipal Stormwater Management Plan (MSWMP), last revised May 2009, the proposed project is not defined as a "major development" considering the limit of disturbance is less than 1 acre and new impervious area is less than 1/4 of an acre. Therefore, groundwater recharge, water quantity, and water quality requirements per the MSWMP and the NJDEP Stormwater Management Rules (NJAC 7:8) are not applicable.

Stormwater management for the proposed project will include an above-ground infiltration system and pervious pavement located at parking locations. Type 'B' inlets routed to the above-ground infiltration system will collect run off from the drive aisles of the parking lot. The stormwater infiltration basin will use an outlet control structure to attenuate the peak flow rates to the required pre-development condition reductions before discharging into the existing larger basin towards the north east portion of the property. The infiltration systems were designed to have a drain down time of less than 72 hours. Refer to Appendix H for additional information.

3.2 Hydrologic Analysis

A hydrologic computer modelling program called HydroCAD was used to calculate the pre- and post-development stormwater peak flow rates. HydroCAD implements the USDA Soil Conservation Service Publication Technical Release (TR-55) "Urban Hydrology for Small Watersheds" to calculate peak flow rates and volumes for each watershed. NOAA Region D rainfall distribution for a 24-hour rain event was used. The overall watershed was broken down into two smaller watersheds with the pervious and impervious surfaces analyzed separately for each watershed. Watershed area, curve number (CN), and time of concentration (Tc) were calculated for each contributing watershed and are summarized in Appendix B.

Rainfall data was obtained from the National Oceanic and Atmospheric Administration (NOAA) Precipitation Frequency Data Server (PFDS). The rainfall data is summarized in the table below.

Table 2: 24-Hour Rainfall Data

Storm Event	NOAA Precipitation
2-year	3.31 inches
10-year	5.07 inches
100-year	8.56 inches

3.3 Water Quantity

Proposed stormwater measures were incorporated so the peak runoff rates for the 2-, 10-, and 100-year 24-hour storm events match the pre-development peak runoff rates. The post-development stormwater runoff must match the pre-development stormwater runoff that is attributable to the portion of the site on which the project is to be constructed. The pre- and post-development peak flow rates are summarized in the table below.

Table 3: Peak Flow Rates Summary (Design Point 1)

Storm Event	Overall Existing Flow Rate (cfs)	Proposed Flow Rate (cfs)
2-year	0.03	0.03
10-year	0.09	0.07
100-year	0.34	0.21

Table 4: Peak Flow Rates Summary (Design Point 2)

Storm Event	Overall Existing Flow Rate (cfs)	Proposed Flow Rate (cfs)
2-year	0.15	0.14
10-year	0.33	0.21
100-year	1.00	0.96

The Drainage Area Maps are provided in Appendix B & C and runoff analysis for both conditions is provided in Appendix D & E. Since there is no increase in stormwater runoff from pre-development conditions to post-development conditions, the site complies with the NJ Soil Erosions and Sedimental Control Standards, specifically the Standards for Offsite Stability.

3.4 Water Quality

According to the Town of Neptune Municipal Stormwater Management Plan (MSWMP), last revised May 2009, the proposed project is not defined as a "major development". Therefore, water quality requirements per the MSWMP and the NJDEP Stormwater Management Rules (NJAC 7:8) are not applicable.

3.5 Groundwater Recharge

According to the Town of Neptune Municipal Stormwater Management Plan (MSWMP), last revised May 2009, the proposed project is not defined as a "major development". Therefore, groundwater recharge requirements per the MSWMP and the NJDEP Stormwater Management Rules (NJAC 7:8) are not applicable

4.0 CONCLUSION

Since the project is not considered a "major development" considering the limit of disturbance and new impervious area, groundwater recharge, water quantity, and water quality requirements per the MSWMP and NJDEP are not applicable. In addition, with no increase in runoff flow the project meets the offsite stability standards as noted in the NJ Standards for Soil Erosion and Sediment Control.

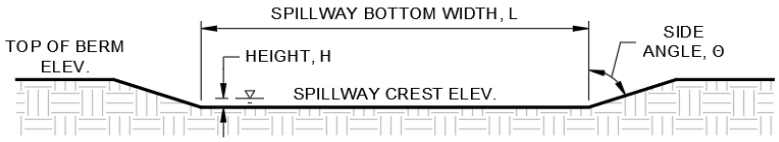
EMERGENCY SPILLWAY

Project Name	Parking Lot Expansion
Location	Neptune Township
Project ID	24-2348-01
Date	10/25/2024
Prepared By	ES

EMERGENCY SPILLWAY CALCULATIONS

Basin ID: Infiltration Basin



$$Discharge, Q = 2.7LH^{3/2}$$

Q_{100} Inflow to Basin	1.4	cfs
Top of Berm Elevation	78	
Spillway Crest Elevation	76.5	
Spillway Bottom Width, L	6	ft
Spillway Side Slope	3	:1

Side Angle, Θ	71.6	deg
Height, H	0.20	ft
Freeboard	1.30	ft
Flow Area Over Spillway	1.3	sf
Velocity Over Spillway	1.1	ft/s

Table 12-1: Allowable Velocities for Various Soils

Soil Texture	Allowable Velocity (ft/sec)
Sand	1.8
Sandy loam	2.5
Silt loam (also high lime clay), loam	3.0
Sandy clay loam	3.5
Clay loam	4.0
Clay, fine gravel, graded loam to gravel	5.0
Cobbles	5.5
Shale (non-weathered)	6.0

Existing Soil Type: Sand

Allowable Velocity 1.8 ft/s

Is the velocity over the spillway less than or equal to the allowable velocity? **Yes**

Is there at least 12" of freeboard? **Yes**

Use
L = 6 ft
